

# SYSTEM ARCHITECTURE & PRODUCT REQUIREMENTS DOCUMENT (PRD)

Integrated Event Management Workspace + Vendor Marketplace

|                                                      |                                         |                                         |
|------------------------------------------------------|-----------------------------------------|-----------------------------------------|
| <b>Version:</b> 3.0 (Consolidated — Source of Truth) | <b>Status:</b> Approved for Development | <b>Supersedes:</b> v2.0 and prior notes |
|------------------------------------------------------|-----------------------------------------|-----------------------------------------|

## 1.0 Executive Summary & System Purpose

The platform is an integrated B2B/B2C ecosystem bridging event logistics and vendor procurement. Verified organizers centrally manage event operations — RSVP tracking, ticketing, guest authentication, and program itineraries — while discovering and booking outsourced services through an integrated Vendor Marketplace.

Event creation is strictly gated to prevent bogus listings, protect platform trust, and sustain a Product-Led Growth (PLG) monetization model. Free users are consumers only; every organizer must be verified and subscribed.

## 2.0 The Gated User Model (No Free Event Creation)

This is a hard architectural rule with no exceptions.

| Capability                               | Personal Workspace (Free) | Verified Business Workspace (Paid) |
|------------------------------------------|---------------------------|------------------------------------|
| Browse public Discovery Page events      | ✓                         | ✓                                  |
| Purchase tickets (GCash / Maya / Cards)  | ✓                         | ✓                                  |
| Receive & confirm RSVP to private events | ✓                         | ✓                                  |
| Create an event (any type)               | ✗                         | ✓                                  |
| Access Vendor Marketplace as a buyer     | ✓ (personal use)          | ✓                                  |
| Requires identity/business verification  | No                        | Yes — mandatory                    |

### Verification Requirements to Unlock Event Creation

- **Individuals (Tier 1):** Government ID + selfie verification
- **Businesses (Tier 2/3):** DTI or SEC registration documents

**Upgrade Path:** A Personal Workspace user who wants to organize even a small private event (e.g., an 18th birthday) must complete identity verification and subscribe to a Tier 1 Starter Workspace before the event-creation UI is unlocked.

### 3.0 The 3-Tier Business Workspace Classification

All 7 event categories are mapped into exactly 3 tiers — no category exists outside this structure, and no tier grants capabilities of another.

| Tier                                                       | Target Audience                                                             | Assigned Event Types                                                                                                                                                                                                                   | Core Capabilities & Hard Limits                                                                                                                                                                                                                                           |
|------------------------------------------------------------|-----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tier 1: Starter</b><br><i>(Mini-Workspace)</i>          | Individuals, independent coordinators, casual milestone hosts               | <ul style="list-style-type: none"><li>• Social Events (Weddings, Birthdays, Anniversaries, Christenings)</li></ul>                                                                                                                     | <ul style="list-style-type: none"><li>• Unlisted/private events only (hidden from Discovery Page)</li><li>• Strict Authenticated RSVP matching (see \$5.0)</li><li>• Hard cap: 300 PAX per event</li><li>• Full access to browse &amp; book Marketplace Vendors</li></ul> |
| <b>Tier 2: Professional</b><br><i>(Business Workspace)</i> | Corporations, academic institutions, SMEs, mid-size agencies                | <ul style="list-style-type: none"><li>• Corporate &amp; Business Events (Retreats, Launches)</li><li>• Conferences &amp; Seminars (Workshops, Conventions)</li><li>• Competitive &amp; Award Events (Galas, Competitions)</li></ul>    | <ul style="list-style-type: none"><li>• Medium-to-large attendee capacity</li><li>• Internal (unlisted) or public listing option</li><li>• Customizable registration &amp; feedback forms</li><li>• Multi-user collaboration — up to 5 Admin seats</li></ul>              |
| <b>Tier 3: Enterprise</b><br><i>(Scale Workspace)</i>      | Major production houses, large-scale organizers (e.g., marathon organizers) | <ul style="list-style-type: none"><li>• Trade Shows &amp; Exhibitions (Expos, Trade Fairs)</li><li>• Festivals &amp; Cultural Gatherings (Music Fests, Parades)</li><li>• Sporting Events (Marathons, Fun Runs, Tournaments)</li></ul> | <ul style="list-style-type: none"><li>• Unlimited PAX capacity</li><li>• Global Discovery Page spotlight listing</li><li>• Integrated PayMongo API for public ticket sales</li><li>• Advanced RBAC — unlimited seats</li></ul>                                            |

**Design Rule:** A given event category is permanently bound to one tier. Organizers cannot mix-and-match capabilities across tiers (e.g., a Tier 1 host cannot unlock public Discovery listing without upgrading to Tier 2/3).

### 4.0 GitHub-Style Role-Based Access Control (RBAC)

Applies within any Verified Business Workspace (Tier 1–3). Roles are strict, pre-defined, and assigned from a dropdown by the Super Admin — no custom or ad-hoc permission sets.

| Role                       | Assigned By                    | Core Permissions                                                                                                                                                                                              | Explicitly Denied   |
|----------------------------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>Super Admin (Owner)</b> | Default<br>(workspace creator) | <ul style="list-style-type: none"><li>• Manages billing &amp; subscription tier</li><li>• Handles legal/identity verification</li><li>• Invites team members via email; assigns roles from dropdown</li></ul> | — (no restrictions) |

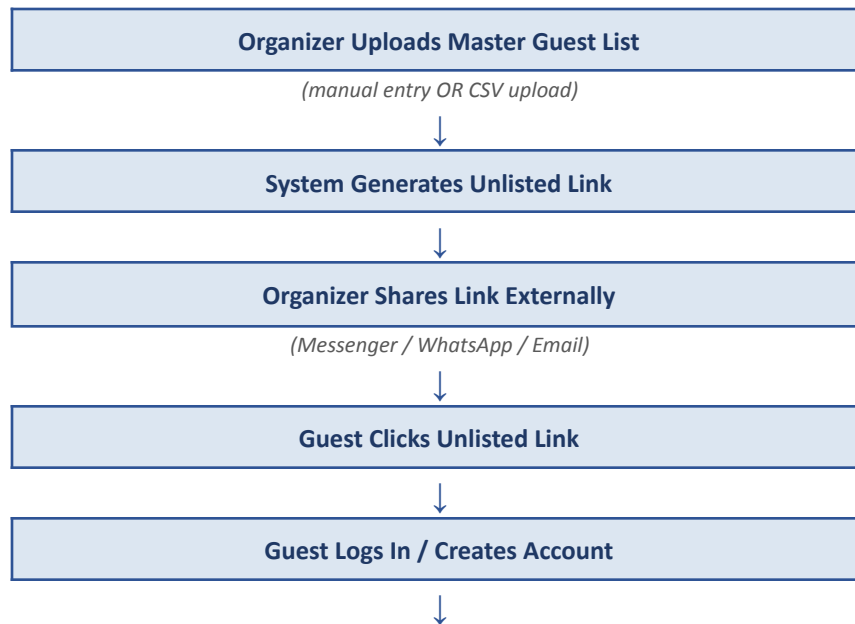

| Role                                  | Assigned By          | Core Permissions                                                                                                                                                                                                                                | Explicitly Denied                                                                                                                         |
|---------------------------------------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
|                                       |                      | <ul style="list-style-type: none"> <li>Unrestricted access to all organizational assets</li> </ul>                                                                                                                                              |                                                                                                                                           |
| <b>Admin (Event Manager)</b>          | Super Admin          | <ul style="list-style-type: none"> <li>Creates &amp; modifies events</li> <li>Manages public ticketing tiers</li> <li>Monitors attendee analytics</li> <li>Communicates with and books external Marketplace Vendors</li> </ul>                  | <ul style="list-style-type: none"> <li>Billing management</li> <li>Workspace-level settings</li> <li>Verification documents</li> </ul>    |
| <b>Vendor-Member (Internal Staff)</b> | Super Admin or Admin | <ul style="list-style-type: none"> <li>In-house staff (technical director, photographer, floor coordinator)</li> <li>Assigned to fulfill logistics for internal events</li> <li>Uses mobile scanner module for entrance verification</li> </ul> | <ul style="list-style-type: none"> <li>Event creation/editing</li> <li>External vendor booking</li> <li>Billing/financial data</li> </ul> |

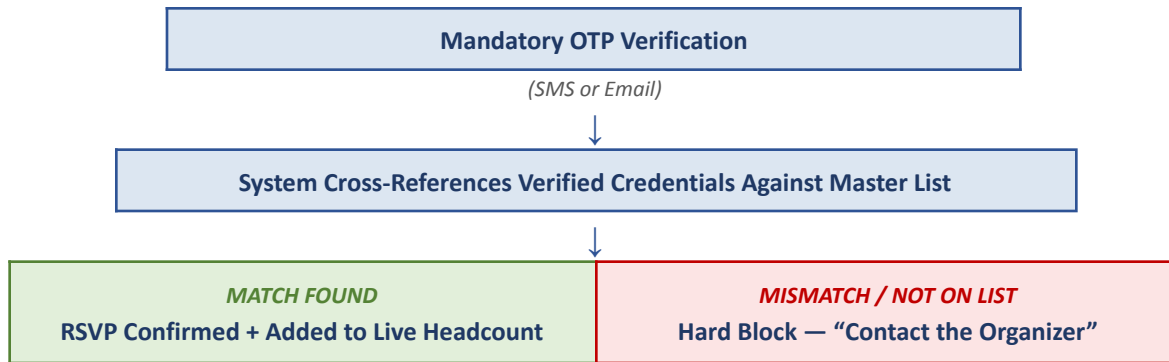

**Seat Enforcement:** Tier 2 workspaces are capped at 5 Admin seats; Tier 3 is unlimited. The system checks active subscription tier before allowing a Super Admin to send an invite — if seats are full, invitation is blocked until upgrade or seat removal.

## 5.0 Strict Authenticated RSVP Flow (Tier 1 Private Events)

*Purpose: absolute privacy and zero manual host maintenance. There is no manual-approval fallback.*

### 5.1 Flow Diagram

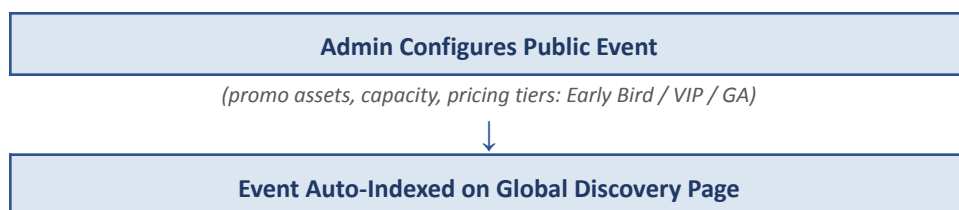

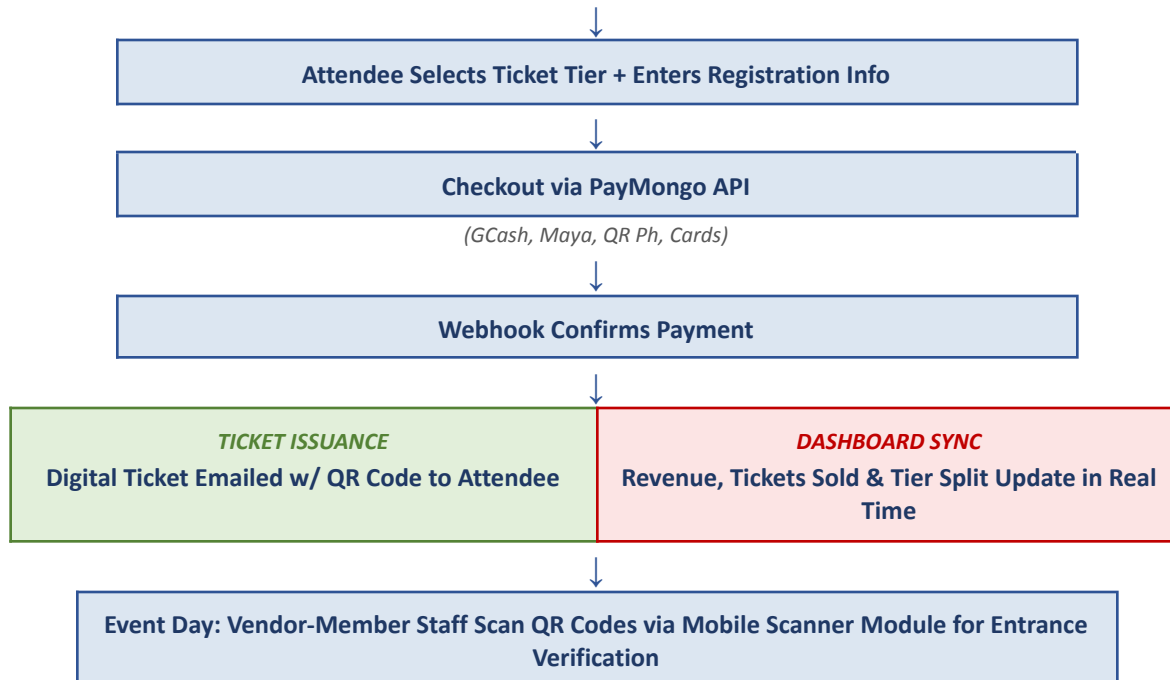

## 5.2 Step-by-Step Logic

1. Master List Configuration (Organizer side): Organizer selects a social template (e.g., Wedding) and uploads the Master Guest List via manual entry or CSV upload.
  - **System Rule:** The primary verification key is the guest's verified email address or mobile number, not their name. Full Name is stored only as a secondary display identifier — this prevents false rejections caused by minor name-spelling typos.
2. Unlisted Link Distribution: System generates a secure, unlisted URL. Organizer distributes it manually through any external channel.
3. Authentication Gate (Guest side): Clicking the link requires the guest to log into an existing Personal Workspace or create a new one, then complete SMS/Email OTP verification. No RSVP action is possible pre-authentication.
4. Backend Matching Logic: Upon RSVP submission, the system compares the guest's verified credential (email/phone) against the Master List.
  - **Condition A — Match:** RSVP status → Confirmed. Guest receives full itinerary, location map, and event guidelines. Organizer's dashboard headcount updates instantly.
  - **Condition B — Mismatch:** Hard block triggers: "Sorry, your verified credentials do not match the invited guest list for this event. Please contact the event organizer directly." This is final — there is intentionally no manual approval fallback, enforcing privacy and eliminating host maintenance overhead.

## 6.0 Public Ticketing & Vendor Marketplace Integration

### 6.1 Tier 3 Enterprise — Public Ticketed Checkout Flow

### Key Mechanics

- No private invitation link is required — this flow is fully open/public, in contrast to the Tier 1 RSVP flow.
- Payment processing, ticket issuance, and dashboard analytics are all triggered off a single webhook confirmation event, keeping the system consistent and idempotent.
- QR scanning at the door is performed by Vendor-Members, not Admins — consistent with the RBAC model in §4.0.

## 6.2 Vendor Workspace Mechanics (Marketplace Supplier Role)

Independent service providers (caterers, photographers, venues, stylists) operate as plug-and-play suppliers.

| Mechanic                | Behavior                                                                                                                                                                |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storefront              | Vendor displays portfolio assets, service tags (mapped strictly to system-defined event categories), and pricing structures                                             |
| Inquiry & Communication | Vendor receives direct messages and file attachments (mood boards, layout references, design briefs) from organizers                                                    |
| Booking Approval        | <b>Manual only — never auto-accepted.</b> Vendor reviews each request and approves/rejects based on schedule fit and chat negotiation                                   |
| Calendar Lock           | Upon approval AND payment confirmation, the system automatically locks that date/time slot on the vendor's per-service availability calendar, preventing double-booking |

## 7.0 Monetization Framework

---

Three deliberately distinct revenue streams, structured so basic consumer interactions (browsing, RSVPing) are never taxed.

| Stream                                  | Type                          | Mechanics                                                                                                                                                                                                         |
|-----------------------------------------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Vendor Marketplace Commission</b>    | Primary transactional revenue | Percentage-based commission automatically split on every successful vendor booking processed through the payment gateway. Vendors list for free — platform monetizes conversion and booking volume, not listings. |
| <b>Workspace Subscriptions</b>          | Recurring SaaS revenue        | Tier 1 (Starter), Tier 2 (Professional), Tier 3 (Enterprise) organizers pay flat monthly/annual fees for verified workspace access, PAX capacity, and admin tooling.                                              |
| <b>Customization Micro-Transactions</b> | Pay-as-you-go                 | Tier 1 Starter users on free baseline templates (e.g., standard birthday layouts) can pay one-time fees to unlock advanced custom UI layouts and complex program-flow builders.                                   |

## 8.0 Cross-Cutting System Rules (Consolidated)

---

These rules apply platform-wide and resolve any ambiguity between sections above:

1. No event, of any tier, can be created from a Personal Workspace. Event creation is the single hard gate behind verification + subscription.
2. Tier defines both capability ceiling and floor — a Tier 1 workspace cannot go public, and a Tier 3 workspace's events are never limited to 300 PAX. Tiers are not stackable or partially upgradable per-event.
3. RBAC roles are exhaustive — Super Admin, Admin, Vendor-Member are the only three roles in a Business Workspace. No custom roles.
4. RSVP matching always keys on verified email/phone, never on name string matching.
5. Tier 1 RSVP mismatches are terminal — there is no support-ticket or manual override path baked into the core flow.
6. Vendor bookings are never auto-accepted, regardless of organizer tier.
7. Calendar locking is payment-gated — approval alone does not lock a vendor's calendar; confirmed payment is required.

*(End of Document — v3.0 Consolidated Source of Truth)*
